### Comments

With no tailpipe emissions, the electric ID.5 naturally scores the full 10 points in the Clean Air part of the assessment.
# Energy Efficiency Tests

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Average</td>
<td>18.0 kWh/100 km</td>
</tr>
<tr>
<td>Worst-case</td>
<td>33.4 kWh/100 km</td>
</tr>
</tbody>
</table>

**Comments**

The ID.5 demonstrates impressively low consumption values in the 23°C Cold and Warm start laboratory tests – ca. 16 kWh/100 km. The high heating demand in the -7°C Cold Ambient Test more than doubles that figure, to 33.4 kWh/100 km. Good aerodynamics help the ID.5 complete the Highway cycle using just 21.6 kWh/100 km – one of the best results measured by Green NCAP in that test, sufficient for a range of 390 km. The standard On-Road Drive was performed at around 9°C and the ID.5 needed about just 17.5 kWh/100 km, which results in an expected driving range of about 480 km.
### Greenhouse Gases Tests

**Comments**

This Index is based on a Well-to-Wheel+ approach, meaning that the GHG emissions related to the supply of the energy are added to those of the tailpipe. The vehicle’s production is not yet included in the assessment due to the implicit limitations of generic data about global supply chains, but its estimated value can be found in Green NCAP’s LCA results. As the ID.5 is purely electric, its GHG emissions originate only from the processes of electricity supply, ca. 45–94 g CO₂-eq./km, depending on the consumption. Thanks to its highly efficient powertrain and charger and the relatively low CO₂ emissions of EU electricity mix, the car scores a high 9.6 out of 10.
Our Verdict

Tested here is the Volkswagen ID.5 Pro Performance with 150 kW and 77 kWh battery. Even though the car weighs more than 2.100 kg due to its big battery, the demonstrated efficiency performance is impressive. The recorded consumption values are among the lowest measured by Green NCAP so far. The energy demand in the -7°C Cold Ambient Test is high, but this is the price of comfortable in-cabin heating and battery management strategies despite the presence of both a PTC heater and a heat pump. The large battery enables the vehicle to drive a little more than 500 km according to the WLTP+ procedure. With the high consumption measured in Green NCAP’s Cold Ambient Test, a range of 250 km can be covered starting with a full battery, but around 480 km can be expected under moderate ambient conditions in a real-world drive. The usable battery capacity measured by Green NCAP matches exactly the officially declared value of 77 kWh. When charging with 11 kW, the overall efficiency from the grid to the output side of the battery is an impressive 91.1%. The VW ID.5 presents a lot of the progress electric vehicles are making nowadays and easily reaches an Average Score of 96% and 5 Green stars.
